

What are voids? Voids are weird places that are mysterious in the universe and humans don't know what they are made of. Some speculate that they are made of dark matter, others say it's another universe/planet and with a lot of science and work for 5 years we know they are planets or other stuff. What are void planets? Void planets are planets that rotate a star made of entirely of dark matter and even though it's not possible in the main universe that humans are living in, it's possible on another one and void stars (that's the name of dark matter suns) they helium-3 instead of helium-4 and they smash deuterium and and tritium together to make helium-3 in their cores. What are void residents? Void Residents are people that are from the void universe and one of them is called JH-2832 which is the only void universe that is identical to the universe humans live in and there are over 100 void universes that humans can't name them all. Is there a void planet that looks like earth? Yes there is, and it's called IE-556 it's a planet that looks eerily like earth that every 5 months it travels 800,000 miles to go to the humans' universe and when it gets close enough the humans can see it and IE-556 follows 365 days in a year and instead of 24 hours it's 25 hours and the lifeforms on IE-556 are the same on earth.
